

Day 5: DevOps

YUGESHWARAN G

Create GitHub repo:

"**Add** and **commit** all files to the remote repository."

```
student@mcaccl-6:~/kubernetes-days/day5$ git init
hint: Using 'master' as the name for the initial branch. This default branch name
hint: is subject to change. To configure the initial branch name to use in all
hint: of your new repositories, which will suppress this warning, call:
hint:
hint:   git config --global init.defaultBranch <name>
hint:
hint: Names commonly chosen instead of 'master' are 'main', 'trunk' and
hint: 'development'. The just-created branch can be renamed via this command:
hint:
hint:   git branch -m <name>
Initialized empty Git repository in /home/student/kubernetes-days/day5/.git/
student@mcaccl-6:~/kubernetes-days/day5$ git branch -M main
student@mcaccl-6:~/kubernetes-days/day5$ git add .
student@mcaccl-6:~/kubernetes-days/day5$ git commit "Initial commit"
error: pathspec 'Initial commit' did not match any file(s) known to git
student@mcaccl-6:~/kubernetes-days/day5$ git commit -m "Initial commit"
[main (root-commit) 262f6c8] Initial commit
13 files changed, 177 insertions(+)
create mode 100644 README.md

```

Push local changes to the remote repository

```
student@mcaccl-6:~/kubernetes-days/day5$ git push origin main
Username for 'https://github.com': iamJABASTIN
Password for 'https://iamJABASTIN@github.com':
Enumerating objects: 18, done.

To https://github.com/iamJABASTIN/DevOps-day-5.git
 * [new branch]      main -> main
```

Create a Jenkins config file **Jenkinsfile**

A **Jenkinsfile** is a script that defines a **Jenkins pipeline**. It outlines how Jenkins should build, test, and deploy your code. Instead of manually configuring Jenkins jobs through the web interface, you can store the entire pipeline as code in your repository

```
student@mcaccl-6:~/kubernetes-days/day5$ nano Jenkinsfile
student@mcaccl-6:~/kubernetes-days/day5$ cat Jenkinsfile
pipeline {
    agent any
    environment {
        DOCKER_IMAGE = "iamjabastin/docker-app:latest" // Change this to your registry
        CONTAINER_NAME = "docker-running-app"
        REGISTRY_CREDENTIALS = "docker-hub-jabastin" // Jenkins credentials ID
    }
    stages {
        stage('Checkout Code') {
            steps {
                withCredentials([usernamePassword(credentialsId: 'github-jabastin', usernameVariable: 'GIT_USER', passwordVariable: 'GIT_TOKEN')]) {
                    git url: "https://$GIT_USER:$GIT_TOKEN@github.com/iamJABASTIN/DevOps-day-5.git", branch: 'main'
                }
            }
        }
        stage('Build Docker Image') {
            steps {

```

Enable and Start the Jenkins

```
student@caccl-6:~/kubernetes-day5/day5$ sudo systemctl enable jenkins
[sudo] password for student:
Synchronizing state of jenkins.service with SysV service script with /usr/lib/systemd/systemd-sysv-install.
Executing: /usr/lib/systemd/systemd-sysv-install enable jenkins
student@caccl-6:~/kubernetes-day5/day5$ sudo systemctl start jenkins
student@caccl-6:~/kubernetes-day5/day5$
```

Vist the Jenkins in Port 8080

Jenkins Pipe Line

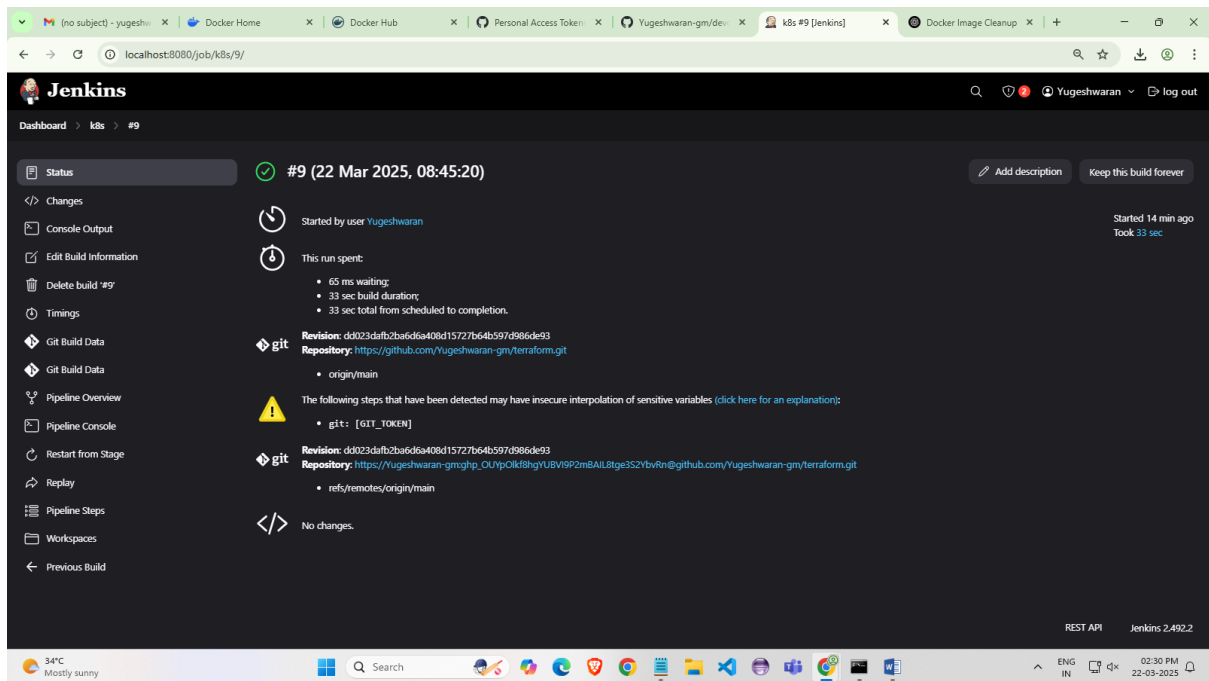

Create a Jenkins Pipeline

Push the Jenkins file to the Remote Repo

Install **Kubernetes plugin** in Jenkins

Build the Jenkins

Build successful

To test Frontend

```
student@maccc1-6:~/kubernetes/k8s$ minikube service frontend-service --url
http://127.0.0.1:37341
! Because you are using a Docker driver on linux, the terminal needs to be open to run it.
```

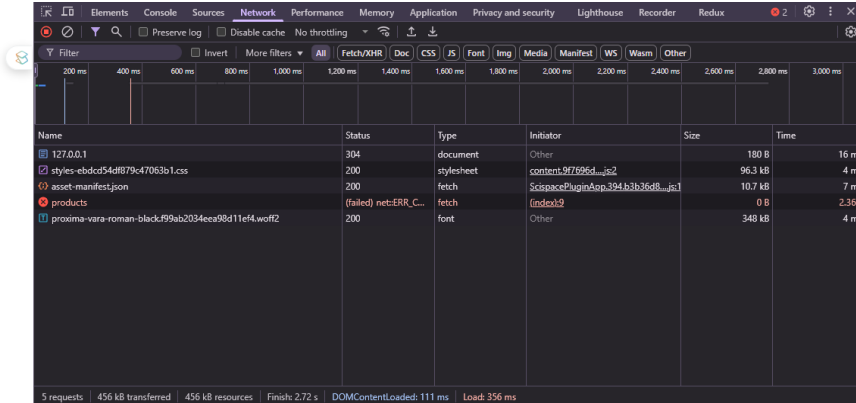

To Test backend

```
student@maccl-0:~/kubernetes/k8s$ kubectl run test-pod --image=alpine --restart=Never -it -- sh
If you don't see a command prompt, try pressing enter.
/ # kubectl get pod test-pod
sh: kubectl: not found
/ # kubectl exec -it test-pod -- sh
sh: kubectl: not found
/ # apk add curl
fetch https://dl-cdn.alpinelinux.org/alpine/v3.21/main/x86_64/APKINDEX.tar.gz
fetch https://dl-cdn.alpinelinux.org/alpine/v3.21/community/x86_64/APKINDEX.tar.gz
